

Strengthening Obstetric Transfusion Safety: Insights from Haemovigilance

Delayed and Avoidable Transfusions in Obstetrics

Vera Rosa, SHOT Incident Specialist

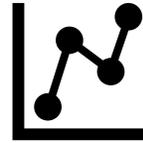

Shruthi Narayan, SHOT Medical Director

Outline

Overview of SHOT and of reported cases

Key themes of avoidable and delayed transfusions

Case-studies and resources

Q&A

All cases are anonymised

All based on information provided to SHOT via Dendrite reporting system

Are representative of the data supplied

All used for educational purposes

What is SHOT?

SHOT Serious Hazards of Transfusion

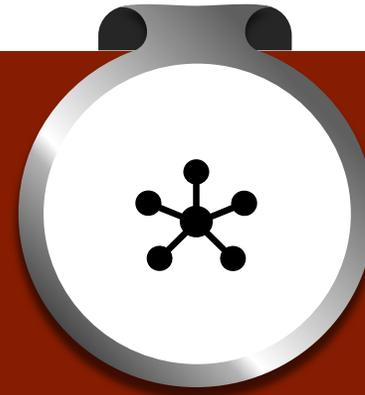

Collects reports

Transfusion safety incidents (reactions, errors, near misses) from hospitals across the UK

Analyses data

To understand what went wrong, why it happened and how it can be prevented

Shares learning

Through annual reports, guidance documents and education to improve practices, both clinical and laboratory

Improve safety

Work collaboratively with patients and key stakeholders to promote best practices and reduce transfusion risks

Do you have a structured way of collecting transfusion-related incident reports in obstetrics such as delays, wrong component issued, or avoidable transfusions? (single response)

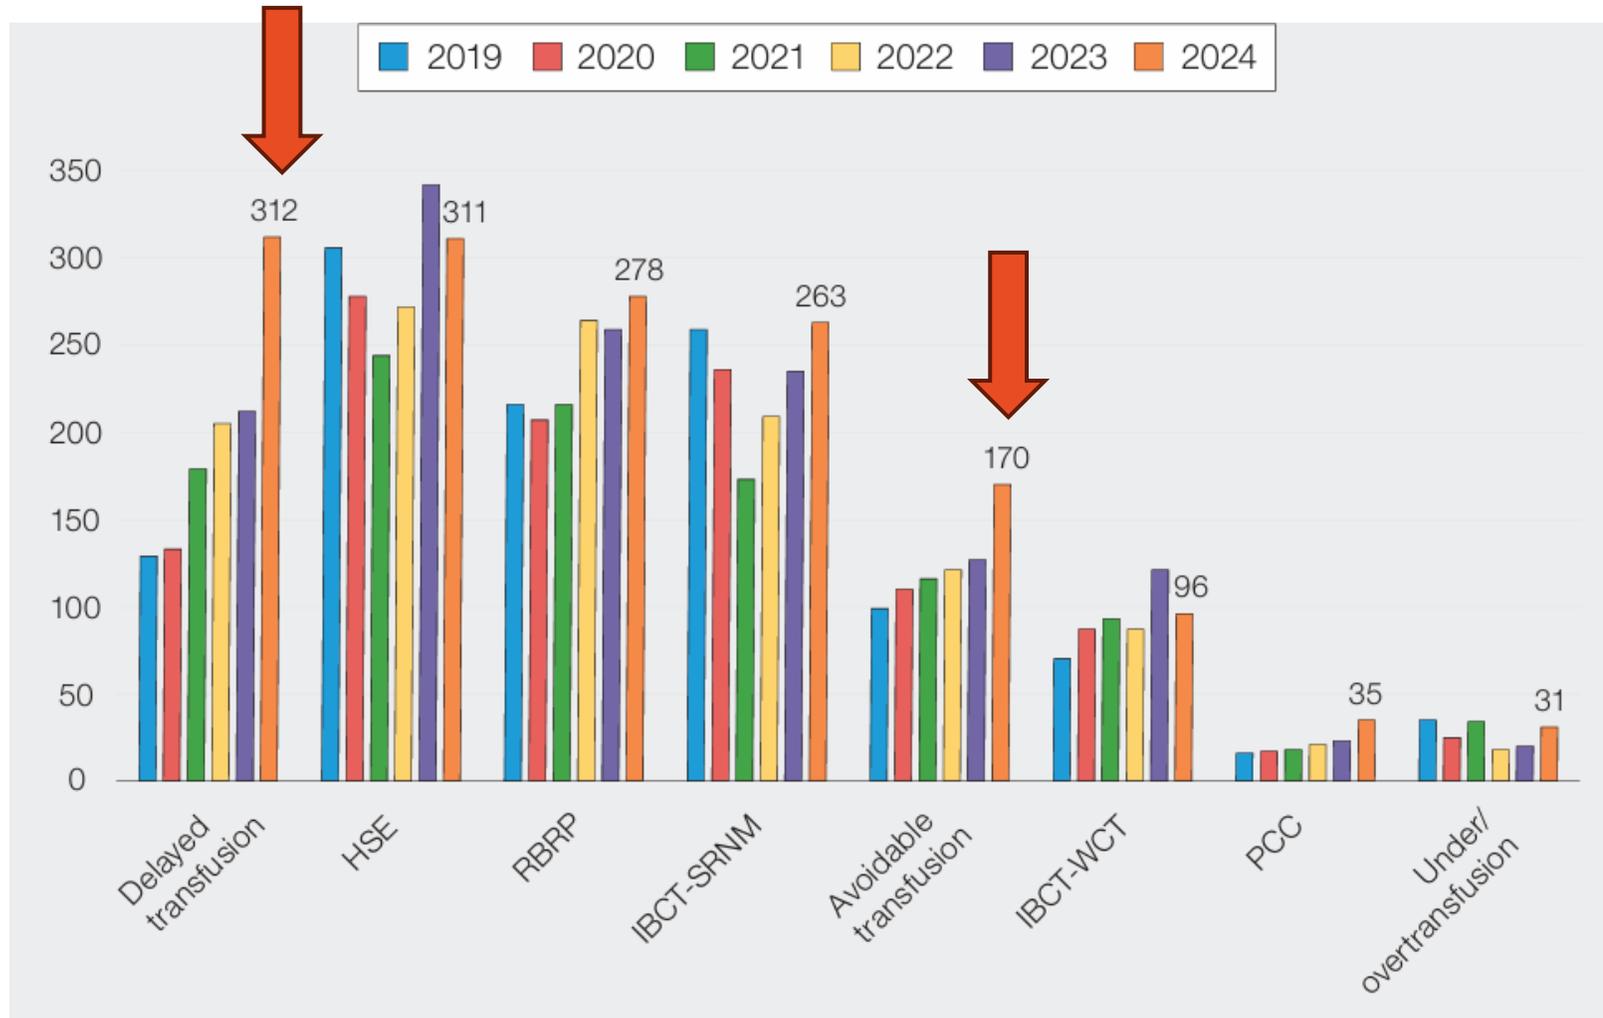

- 🔴 Yes- in all these categories
- 🔴 Yes- only in certain categories
- 🔴 No
- 🔴 Don't know

If you collect these incidents, what are the **recurring themes** in your local investigations?

(Multiple responses)

- Clinical decision making
- Recognition of bleeding
- Communication gaps
- Documentation challenges
- Stock availability
- Team coordination issues
- Leadership and safety culture

5-years SHOT in numbers

HSE – Handling and storage

RBRP – Right blood right patient

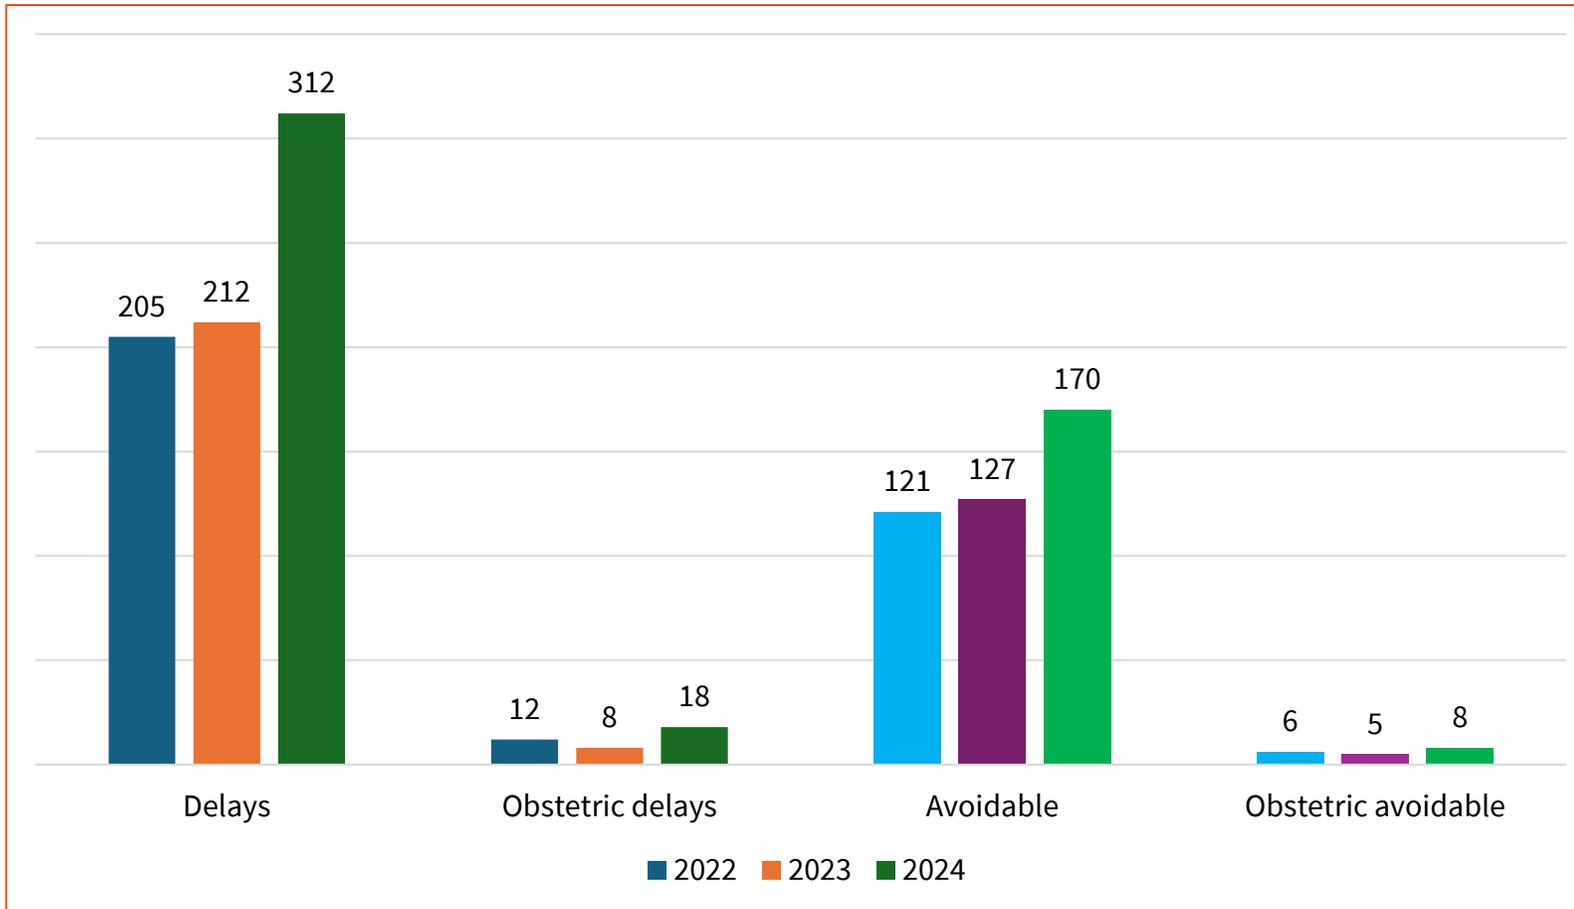

IBCT – Incorrect blood component transfused

SRNM – Specific requirements not met

WCT – Wrong component transfused

PCC – Prothrombin complex concentrate

Delayed and avoidable transfusions in obstetrics

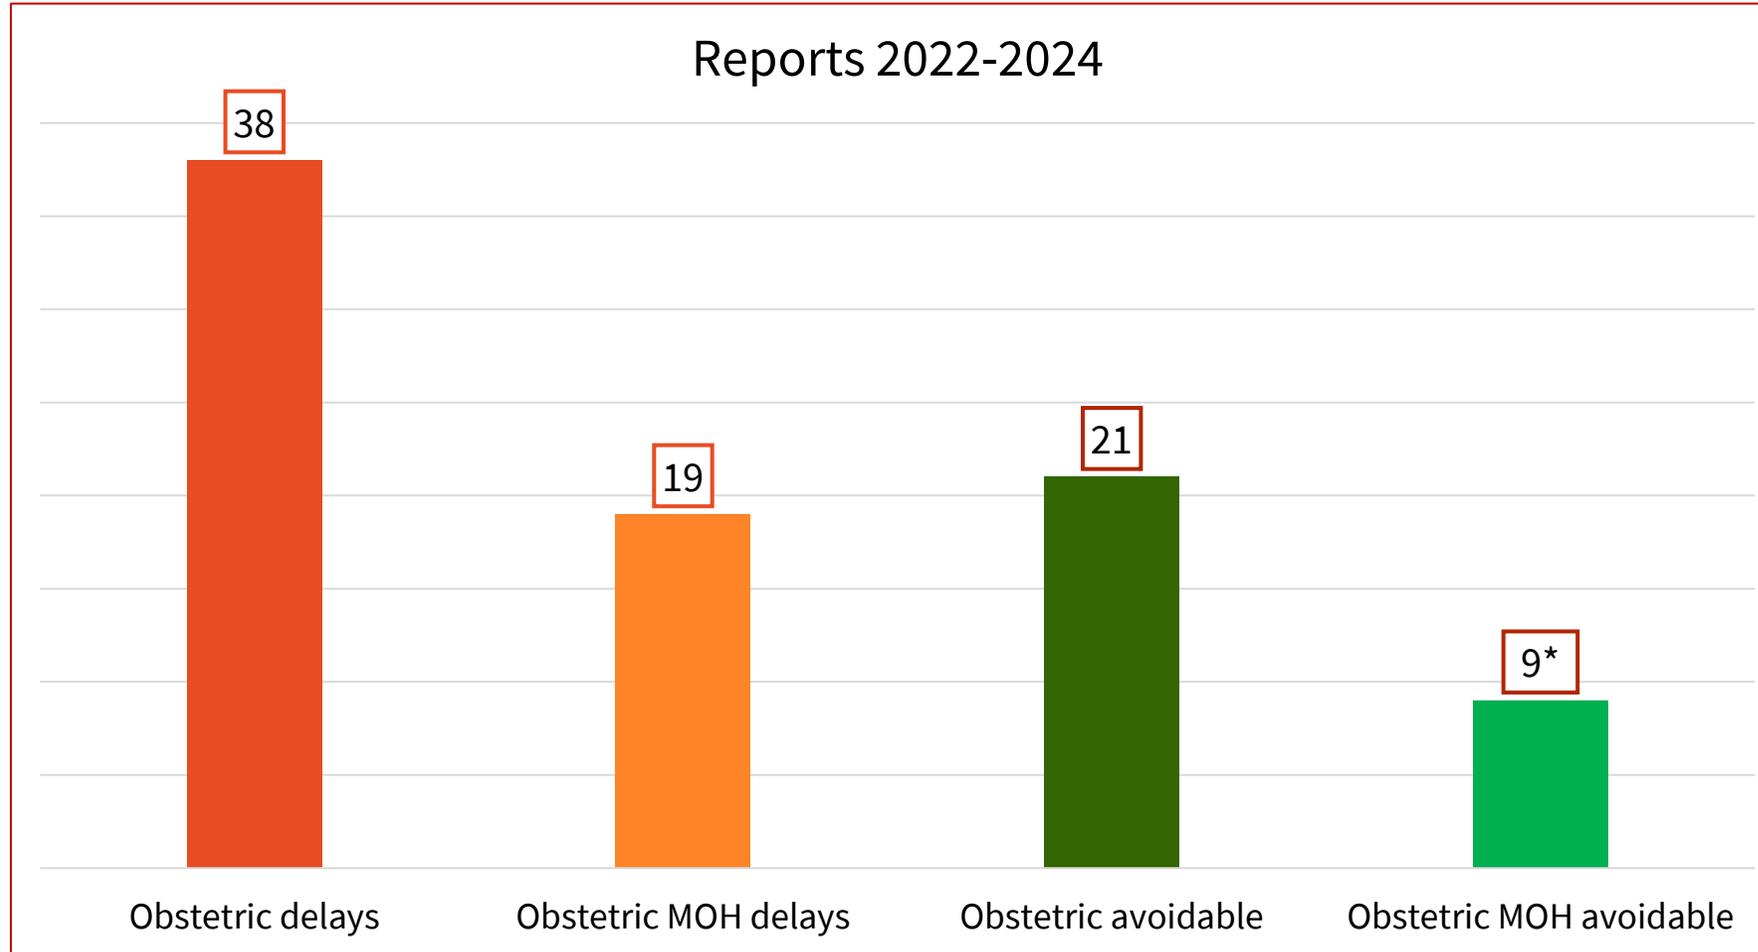

Delayed transfusions in obstetrics account for 5.1% of all delayed transfusions reported in the last 3 years

Avoidable transfusions in obstetrics account for 4.5% of all avoidable transfusions reported in the last 3 years

Delayed and avoidable transfusions in major obstetrics haemorrhage (MOH)

50% of delayed transfusions in obstetrics were in MOH situations

43% of avoidable transfusions in obstetrics were in MOH situations

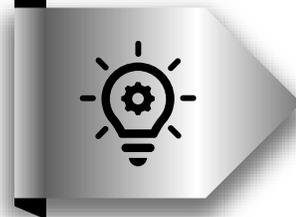

Key themes in the errors reported

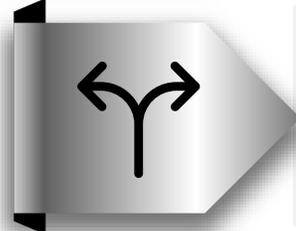

Communication gaps including urgency not communicated to the laboratory or between clinical teams; handover issues

Staffing issues- number, skill mix, experience

Staff training and knowledge gaps

Misinterpretation of point of care (POCT) results, poor management of haematinic deficiency

Pressure on laboratory staff to accept mislabelled sample during a MOH

A MOH was activated following a placental abruption requiring emergency hysterectomy. The activation didn't include a phone number for the laboratory staff to contact the clinical team.

When the laboratory staff got hold of the clinical team the biomedical scientist (BMS) requested a group and screen sample (G&S) as none was available to issue group-specific or crossmatched blood.

In this phone call the BMS explained that emergency blood was available if they could not wait for the sample to be processed. The clinical team informed the BMS they could wait.

When the sample arrived at the laboratory the BMS noted that the sample had been mislabelled and consequently was rejected as per protocol. The clinical team was informed and a new G&S sample requested.

Pressure on laboratory staff to accept mislabelled sample during a MOH

At this point two units of emergency O D-negative were issued. The BMS informed the clinical team that the stock of O D-negative units were low and for the clinical team to send a repeat G&S sample as soon as possible.

The clinical team contacted multiple times the laboratory afterwards asking to amend the labelling on the rejected sample. The BMS informed that was not possible as it was against local policy.

During these phone calls and upon BMS rejection to accept the amendments, the clinical team accused the BMS to allow the stock of emergency units of running out, and of the negative impact that could cause to the patient.

Following these phone calls, the BMS who was working alone out-of-hours felt pressurised, stressed and his decision-making affected. The BMS decided to escalate this situation and sought support from their manager.

Pressure on laboratory staff to accept mislabelled sample during a MOH

As the patient had a previous blood group, the laboratory manager advised the BMS to issue O D-positive red cells to avoid delays and maintain blood supply.

Due to these pressures added to a high workload, the BMS contacted later their manager asking for another member of staff as they felt they could not deal with the situation effectively.

The laboratory manager arrived soon after reassuring the BMS of their decision and actions throughout the shift .

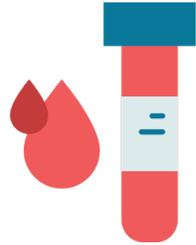

In total the patient received 4 units of O D-negative and 2 units of O D-positive red cells, 10 units of fresh frozen plasma (FFP), 4 units of cryoprecipitate and 2 pools of platelets. The patient recovered and survived.

2023 SHOT and UKTL Suggestions and ideas to discuss and

2023 SHOT and UKTL Transfusion Laboratory Culture Survey (NHS, Independent hospitals and UK Blood Services) Summary

Aim of this document and its impact

- The 2023 SHOT and UKTL laboratory culture in laboratories in hospitals and haemovigilance team. The summary is through this link: <https://www.shotuk.org>
- The survey identified issues with staff not feeling safe to raise concerns, mental health and ability to perform to patient safety. In contrast, civility, environment of blame or reprimand as well as promotion of safety culture has been created to support healthcare organisations: <https://www.shotuk.org/resources/current-resources/uktlc/>
- The suggestions provided in this document are already implemented in health safety culture. They are shared here to space to for staff to speak up

SHOT and UKTL aimed to measure and understand the safety culture in laboratories in hospitals and Blood Services in the UK, with input from the MHRA haemovigilance team. In 2019, a survey found evidence of disciplinary action following single quality incidents and pressure from line management to present a false impression of safety within the laboratory. Further concerns have been raised regarding the safety culture within the laboratory and the SHOT and UKTL laboratory culture survey 2023 was distributed to transfusion laboratory professionals to gain more information. A document with suggestions to improve safety culture has been created to support healthcare organisations: <https://www.shotuk.org/resources/current-resources/uktlc/>

Changing culture in workplace is neither overnight. Start with small steps and

Compassionate leadership training; open discussion of assumptions and bias

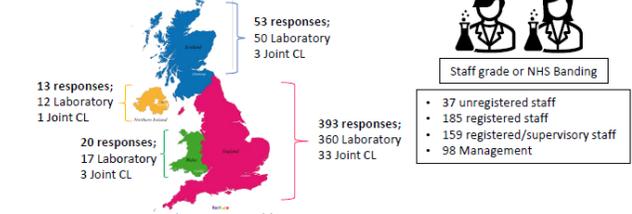

Team building events and social events

Regular 'informal coffee mornings' or 'Lunch and Learn' sessions on civility, workplace policies and related topics

Include '360' element performance reviews for managers (e.g., feedback from those managed as well as manager)

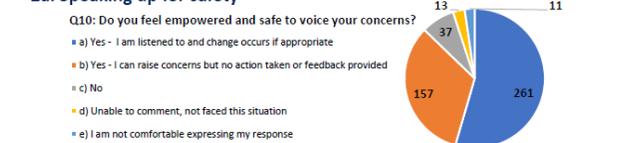

If in your organisation or process to improve [http://www.shotuk.org](https://www.shotuk.org)

1. Demographics

2. Psychological Safety and Civility

2a. Speaking up for safety

Nearly 1 in 5 laboratory staff do not feel psychologically safe in their workplace. Over 2 in 5 felt concerns raised are not acted upon or felt unsafe to raise safety concerns

SHOT Bite No. 24 Speaking up for safety

What will this document cover?

- Designed to support staff in raising their concerns regarding the safety culture within teams or their organisation
- Outlines what Safety Culture is, and the importance of Speaking Up

SHOT Bite No. 23 Civility in Healthcare

A CULTURE OF CIVILITY AND RESPECT IN HEALTHCARE

WHAT IS CIVILITY AT WORK? DOES IT MATTER IN HEALTHCARE? In simple terms it is how we treat each other at work. And how we treat each other matters. Civility is the behaviour that helps to preserve mutual respect at work. Unfortunately, incivility, disrespect, bullying and harassment are often seen within organisations. It has been shown that working in an unkind and rude environment can have a detrimental impact on staff wellbeing, mental health and patient care. Dr Chris Turner from 'Civility saves lives' has stated that when someone is mildly to moderately rude to us, our cognitive ability is reduced by 61%. Therefore, when there is no culture of civility and respect in the workplace the potential of the staff is never reached. Civility in healthcare matters because it reduces errors, fosters excellence and creates a safe environment for staff and patients. **A kind word can change the world.**

Sept 2023

Prescription based on incorrect haemoglobin result leads to an avoidable transfusion during MOH

A MOH was activated during an induction of labor of a twin pregnancy, where the estimated blood loss was approximately 2L.

The nurse got hold of the results from the venous blood gas machine (VBG) misreading the fraction of oxygenated haemoglobin (FiO₂Hb) (87.4) as the haemoglobin (Hb) that was on the line above (116g/L).

Based on the incorrect Hb result one unit of red cells was prescribed, requested and administered to the patient. After the transfusion, the error was identified, and no further units were given.

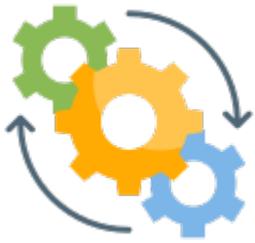

The cause for this event was the small print of the results from the VBG and the high number of different results available on the same print. This was identified as a potential cause for further events especially in emergency situations.

Contributory factors

Emergency requiring quick intervention

Urgency

Design of the point of care results

Incorrect sample labelling leads to avoidable use of emergency O D-negative blood

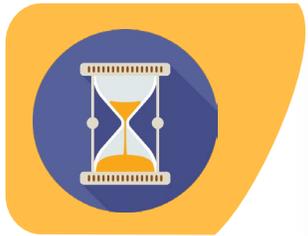

A MOH was activated for a bleeding pregnant woman with placenta accreta. There was no valid group and screen (G&S) sample available to issue crossmatched blood as none had been taken at admission.

The porter arrived at the laboratory with three unlabelled samples (1 for transfusion and 2 for haematology) with the addressographs in their hand. All samples were rejected and the clinical team was informed.

Due to the clinical urgency, emergency O D-negative units were issued. The laboratory staff proceeded to call the Blood Services for an urgent delivery of O D-negative blood as the stock was running low.

The Blood Services staff informed the BMS that they would only process the request once it had been received in their IT system. The BMS replied they would send the request as soon as possible, but that currently they were dealing with a MHP.

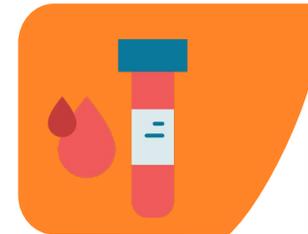

Incorrect sample labelling leads to avoidable use of emergency O D-negative blood

After the incident it was found out that emergency O D-negative units had to be wasted as out of temperature control. This was due to a failure to collect the units from the laboratory refrigerator and stored them in the satellite fridge.

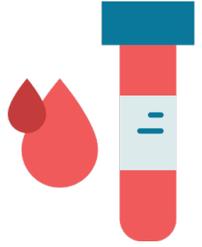

In total the patient received 14 units of red blood cells, 4 units of FFP, 2 units of cryoprecipitate and 3 pool of platelets. The patient recovered and survived.

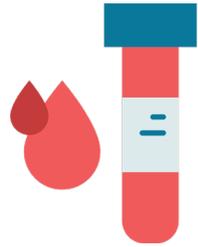

A G&S sample was later tested, and the patient was grouped O D-positive.

Specialist Blood Stocks Management Scheme

Committee Presents:

SHOT and external resources

Patient Blood Management

Patient blood management (PBM) is an approach to managing and preserving an individual's own blood.

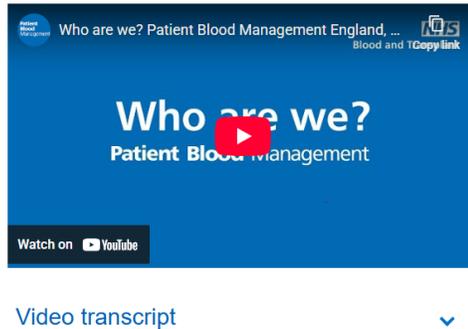

We do this by applying best practices for managing anaemia, bleeding and coagulation, as well as alternatives to transfusion.

Research has shown that PBM strategies can reduce the risk of infection, heart attacks, stroke, death, time spent in hospital and the cost of healthcare.

PBM also helps protect the valuable gift of donated blood components and facilitates their appropriate use.

The resources on these pages are intended to support healthcare providers implementing PBM initiatives and raise awareness of why it matters to everyone.

SHOT Transfusion Safety Standards

For a list of the organisations endorsing the SHOT Transfusion Safety Standards, please visit: [Transfusion Safety Standards - Serious Hazards of Transfusion](#)

- 1 Transfusion safety
- 2 Transfusion information technology (IT) and equipment
- 3 Supporting staff to work safely
- 4 Staff education and training
- 5 Safety culture
- 6 Patients as safety partners
- 7 Haemovigilance and risk management
- 8 Governance

← SHOT Serious Hazards of Transfusion →

Overview of Standards

| | |
|---|--|
| Standard 1. Transfusion safety <p>All blood transfusions will prioritise patient safety and comply with clinical guidance and regulatory requirements.</p> <p>Intention for this standard: To safeguard every transfusion by standardising best practices, minimising risks, and ensuring the right blood is received by the right patient, every time.</p> | Standard 2. Transfusion information technology (IT) and equipment <p>All IT systems and equipment to support safe vein-to-vein transfusion practice are configured, validated, implemented and utilised correctly to their full functionality.</p> <p>Intention for this standard: To ensure reliable, secure, and smart transfusion systems by leveraging technology and equipment that enhance safety, efficiency, and traceability.</p> |
| Standard 3. Supporting staff to work safely <p>Adequate numbers of appropriately trained and supported staff are available to deliver safe transfusions, prioritising staff wellbeing and professional development.</p> <p>Intention for this standard: To create a supportive environment where staff feel empowered, equipped, and valued in delivering safe, high-quality care.</p> | Standard 4. Staff education and training <p>Healthcare organisations ensure that all staff are trained, competent and have access to appropriate development opportunities to support a systems-approach to safe transfusion practice.</p> <p>Intention for this standard: To build confident, competent teams by making safety education and continuous training a cornerstone of everyday practice.</p> |
| Standard 5. Safety culture <p>A just, restorative, learning safety culture is promoted, supported, and embedded across all levels of healthcare organisations to ensure safe transfusions and learning from all events.</p> <p>Intention for this standard: To embed a culture of continuous learning and openness that turns every safety insight into an opportunity for improvement.</p> | Standard 6. Patients as safety partners <p>Patients are informed, supported and involved as 'partners' in their own care to facilitate shared decision-making and safe transfusions.</p> <p>Intention for this standard: To work with patients as active safety partners by fostering open communication, shared responsibility, and a culture of trust in healthcare decisions.</p> |
| Standard 7. Haemovigilance and risk management <p>Healthcare organisations have systems in place to identify, trend and learn from transfusion-related safety events including near misses, and implement effective improvement actions.</p> <p>Intention for this standard: To protect patients and donors by driving safer transfusion practices through vigilant monitoring, timely response, and continuous learning.</p> | Standard 8. Governance <p>Effective transfusion governance systems are in place with adequate oversight to enable organisations to actively manage and improve the safety and quality of transfusion care.</p> <p>Intention for this standard: To facilitate effective transfusion governance within healthcare organisations that ensures patients receive safe and high-quality care.</p> |
